Amazon Kinesis Data Streams

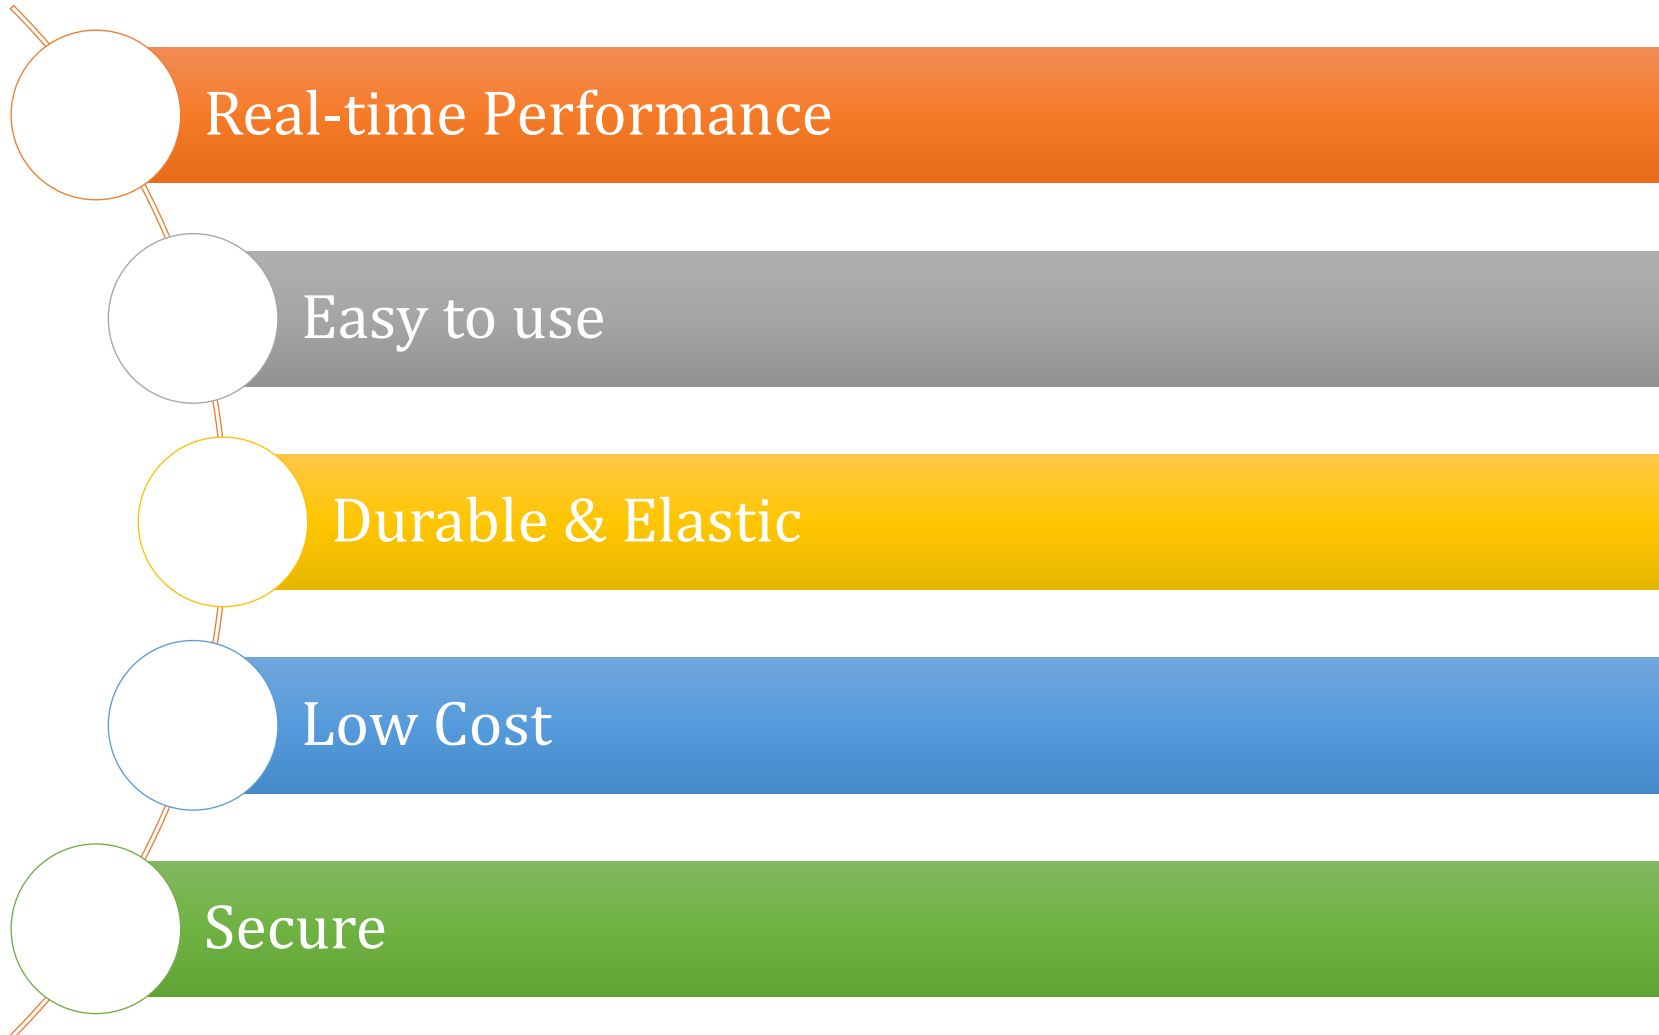

Introduction to Amazon Kinesis Data Streams

- Kinesis Data Streams application reads data from a data stream as data records.
- These applications can use the Kinesis Client Library, and they can run on Amazon EC2 instances.
- Processed records to dashboards, use them to generate alerts, dynamically change pricing and advertising strategies, or send data to a variety of other AWS services.

Case Studies

NETFLIX

Netflix uses Kinesis to monitor the communications between all of its applications so it can detect and fix issues quickly

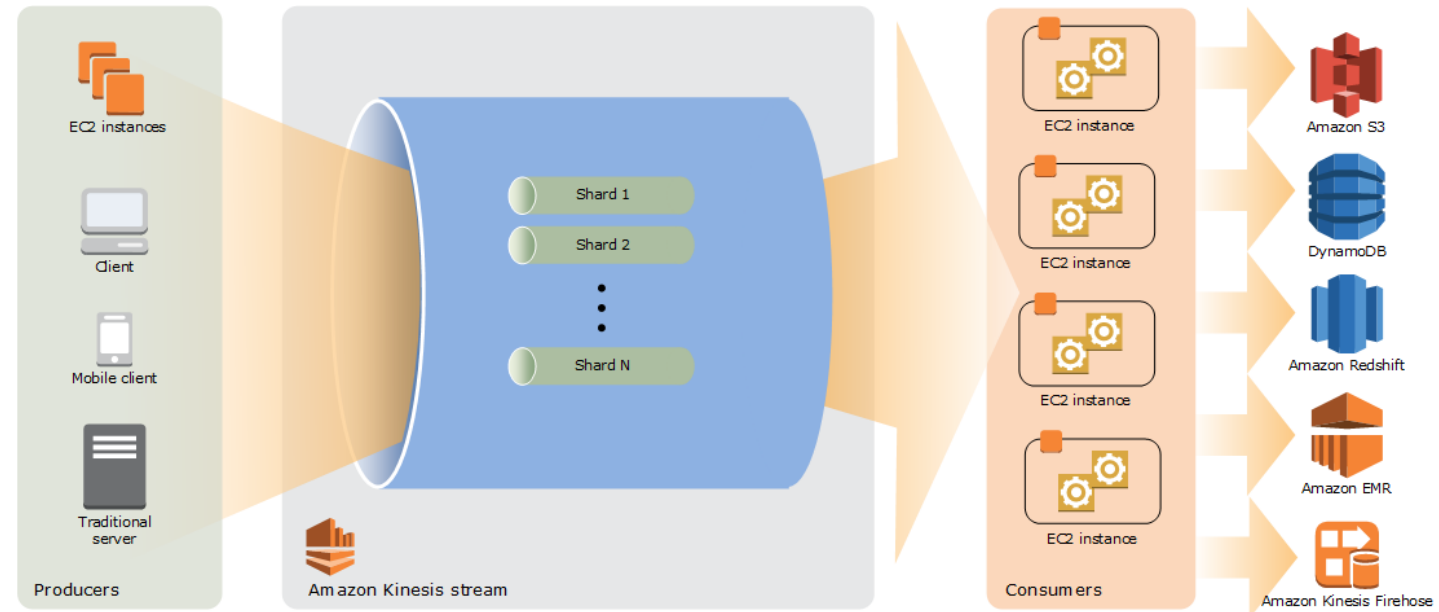

THOMSON REUTERS™

Thomson Reuters built a solution using Amazon Kinesis to gain insights from data generated by its offerings and continuously improve the user experience.

How it works

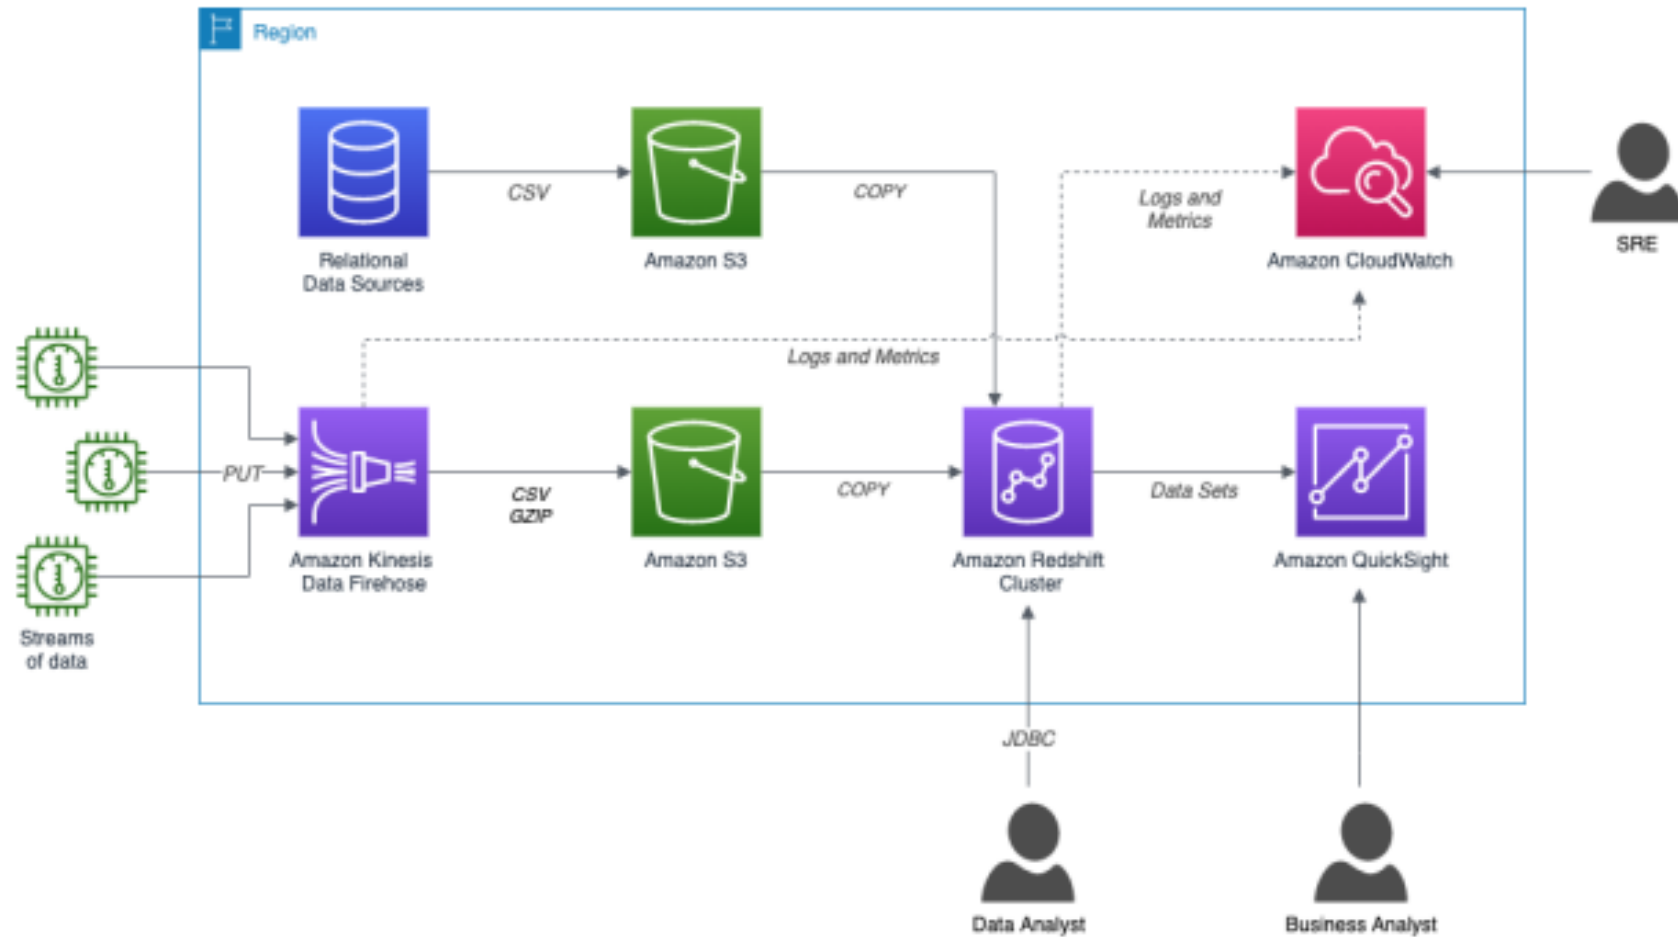

- Collect from sources. Amazon Kinesis Data Streams provides two APIs for putting data into an Amazon Kinesis stream **PutRecord** and **PutRecords**. PutRecord allows a single data record within an API call and PutRecords allows multiple data records within an API call.

- Amazon Kinesis Data Firehose is the easiest way to reliably transform and load streaming data into data stores and analytics tools. You can use a Kinesis data stream as a source for a Kinesis data firehose.

Questions to Consider

- For designing a real-time smart security system, will you consider using Amazon kinesis data firehose? If so, what would be your use case?

Thank You
